

Module 14 - chapter 1

Introduction to Boto Library (AWS SDK for Python)

AWS has lots of services and components

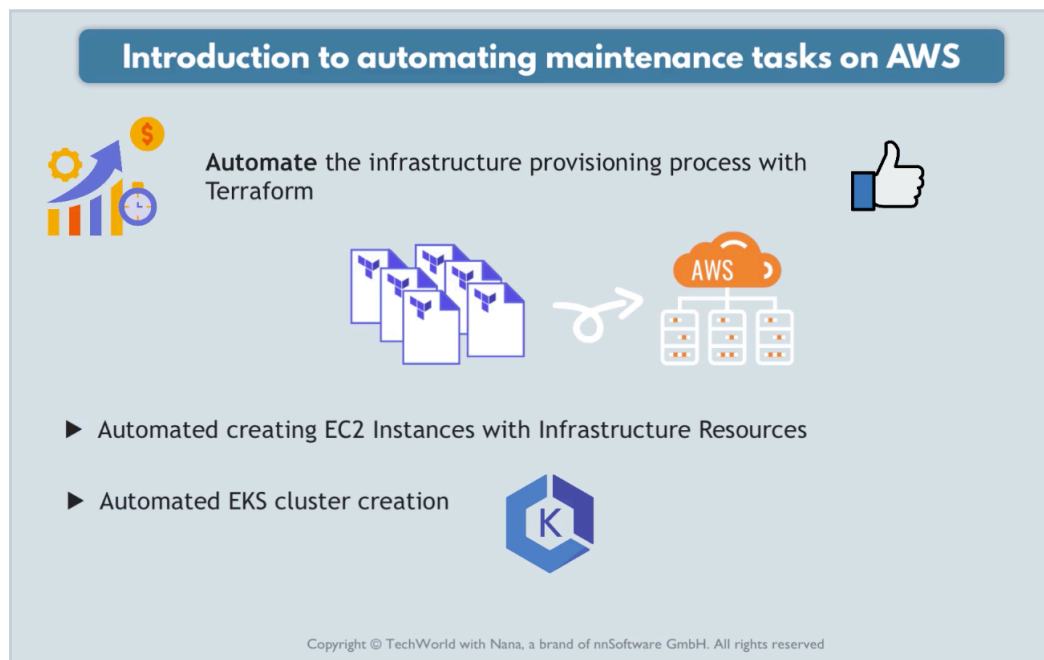

And there are projects that have 1000s of servers

And they can create 1000s of resources

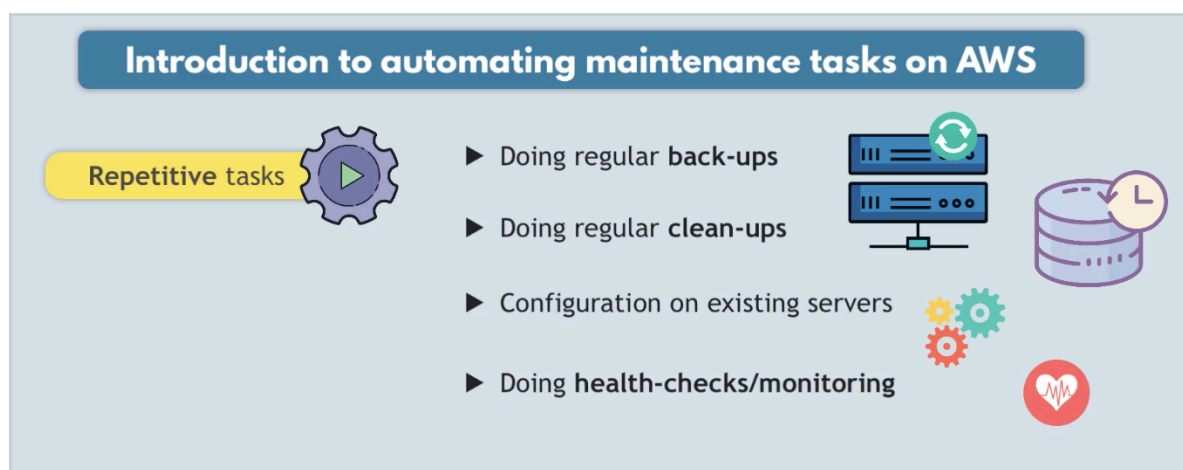

We automated the infra provisioning using Terraform.

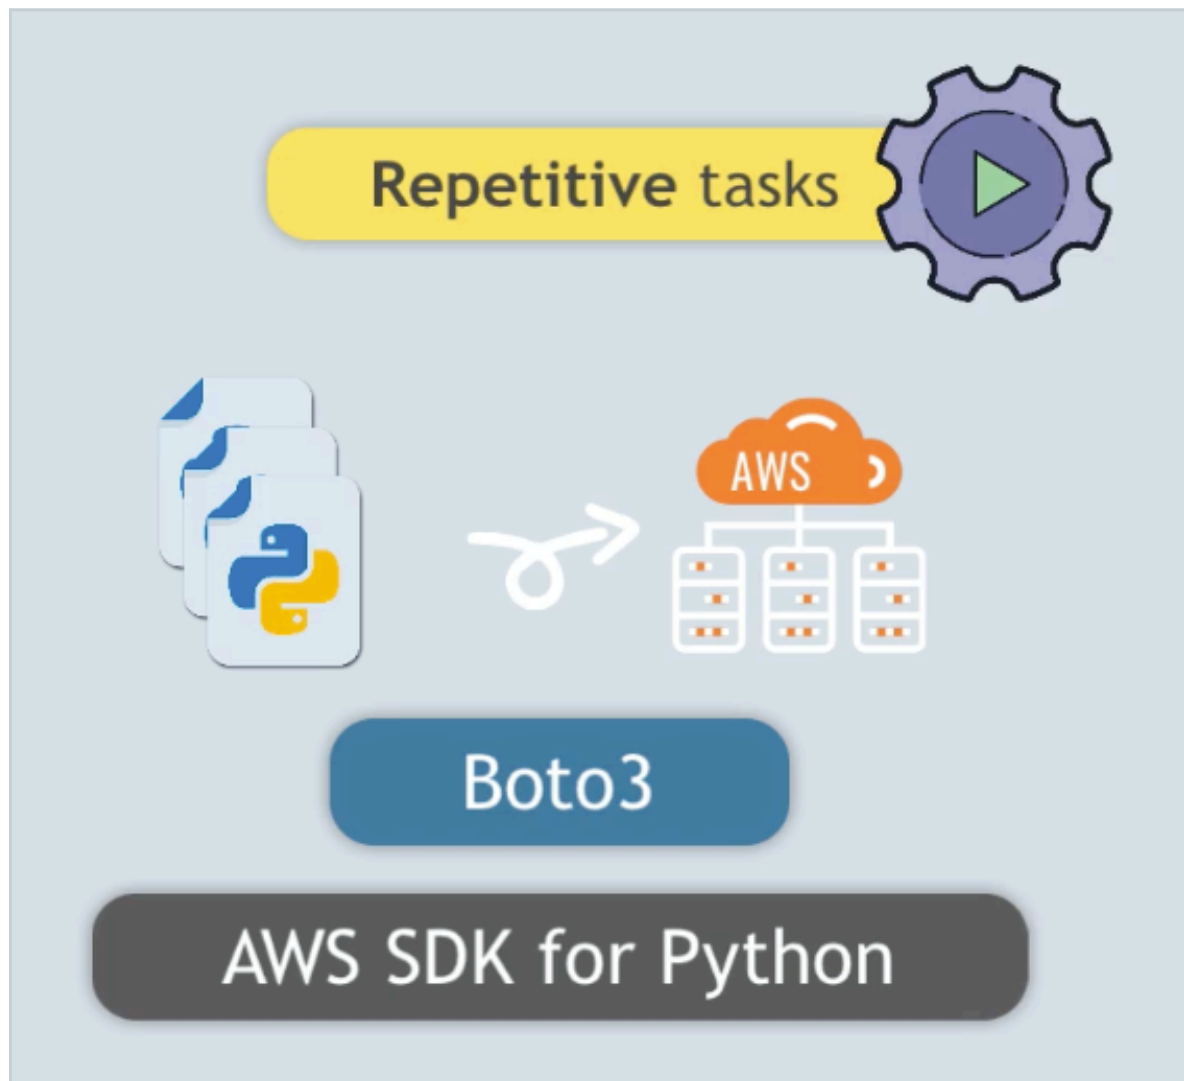

Now that we have the infra we want to automate repetitive maintenance tasks like:

- Doing regular backups
- Doing regular clean-ups
- configuration on existing servers
- Doing health-checks/monitoring

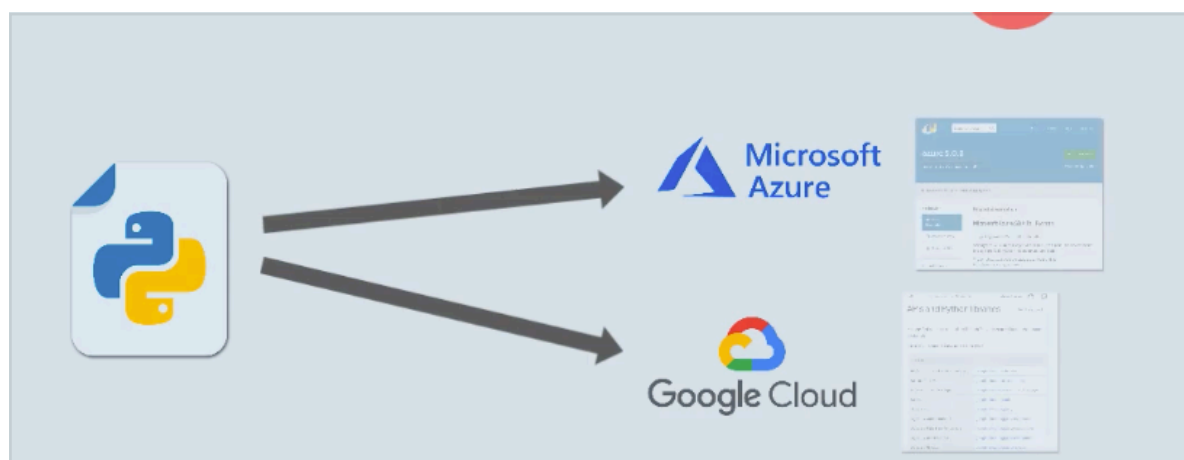

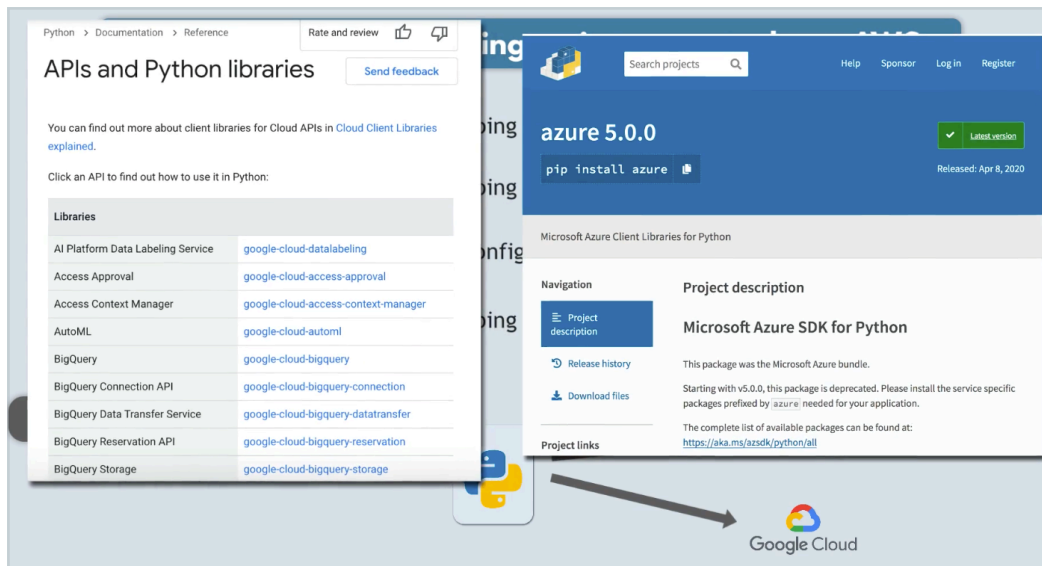

One way to automate those tasks is using Python with the library Boto3 that makes it possible to work with AWS resources.

- create resources
- Configure resources
- fetch data
- etc

If working with other clouds like Azure or Google cloud platform, python has libraries for them as well

Python can do what TF does but it is important to know which tool to use for each specific task

python

► Python can also provision Infrastructure

Terraform

Which tool to use for which tasks?

We will create a VPC with a subnet in AWS using the Boto3 library and then we will compare

What we will do

Connect to AWS account

Create a VPC

Create a Subnet

AWS
account

VPC
